

@audience — middle stage

Appears in: **DL-02**

agents/audience.py:6-66

"The audience agent receives vision data and returns persona_label, age_range, interests, and platform_behavior." ... "Adding the audience agent as a dedicated middle step — its own call, its own narrow input — is what made copy persona-specific."

@audience — middle stage

```
agents/audience.py:6-66

6 def segment(description: str, vision_tags: dict, doc_context: list = None) -> dict:
7     """Derive a target audience persona from product description and vision tags."""
8     try:
9         product_type = vision_tags.get("product_type", "")

62            "interests": ["lifestyle", "shopping", "social media"],
63            "platform_behavior": "Scrolls TikTok daily, engages with trending content",
64            "persona_label": "General audience",
65            "error": str(e),
66        }
```

What it shows: The dedicated middle stage. It receives vision tags (not the raw image) and returns the persona — the step that broke the "general public" circular dependency.
