

@validate

Appears in: **DL-04**

tests/validate.py:56-75

"Zero false negatives on the test set: pass — all 7 patterns detected correctly in @validate."

@validate

tests/validate.py:56-75

```
56 def test_guardrails():
57     section("FR7 - Guardrails (compliance detection)")
58
59     clean_copy = guardrails.check(
60         {"variant_1": "Results guaranteed! Shop now.", "variant_2": "Regular copy here."}
61     )
62     check("Detects 'guaranteed'", any(f["matched"] in ("guaranteed", "guarantee") for f in clean_copy["flags"]))
63     check("Output has clean_copy key", "clean_copy" in clean_copy)
64     check("Output has flags key", "flags" in clean_copy)
65     check("Flags is a list", isinstance(clean_copy["flags"], list))
66
67     clean_copy2 = guardrails.check(
68         {"variant_1": "Clinically tested formula.", "variant_2": "Also clinically proven."}
69     )
70     check("Detects health/scientific claims", len(clean_copy2["flags"]) >= 1)
71
72     clean_pass = guardrails.check(
73         {"variant_1": "Stay hydrated, stay green.", "variant_2": "Your gym companion."}
74     )
75     check("Clean copy returns empty flags", len(clean_pass["flags"]) == 0)
```

What it shows: The acceptance test asserting guardrails detects "guaranteed" and clinical/scientific claims, and returns an empty flags list on clean copy — the zero-false-negative evidence.
